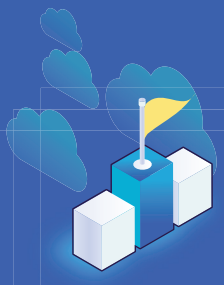
NOS VALEURS NOUS ENGAGENT

Dans notre entreprise, au sein de Cabsoc Group, nous partageons des valeurs exigeantes que nous veillons à incarner au quotidien :



L'ENGAGEMENT : s'impliquer à 100% dans chaque projet, mettre tout en œuvre pour proposer le meilleur produit et le meilleur service, ne rien lâcher tant que le projet n'est pas finalisé tel qu'il a été demandé. L'engagement c'est aussi des co-équipiers qualifiés, exigeants, et curieux des dernières évolutions de leurs métiers.

LA RÉACTIVITÉ : une organisation centrée Client, déterminée sur le respect des délais, structurée selon des process qualifiés et flexibles, animée par des équipes disponibles et rigoureuses.

L'ENTRAIDE : une culture du faire ensemble, avec toutes nos parties prenantes (co-équipiers, clients, fournisseurs, société civile...), pour répondre aux challenges du quotidien et ceux de demain. Un état d'esprit de coopération, pour faciliter la résolution des difficultés, favoriser la transmission des savoir-faire, nourrir le savoir-être, encourager chacun à faire mieux.

LA SIMPLICITÉ : être simple, c'est être authentique, sans artifice. C'est aller à l'essentiel, rester ouvert, et savoir se remettre en question. Faire simple, c'est avoir le comportement adapté pour... simplifier les choses.

SOCAH HYDRAULIQUE

NOUS CONSTRUISONS **DES RELATIONS DURABLES**

Nous souhaitons un avenir durable et profitable à nos clients, nos fournisseurs, et nos co-équipiers. Nous avons donc à cœur de vous accompagner dans la durée, avec implication et passion.

Pour bien vous servir nous travaillons en équipes soudées, où chacun peut interagir et compter sur son collègue pour résoudre une difficulté, déterminer collectivement une solution, et améliorer nos produits et services.

Cette ambition se construit tous les jours dans la confiance, par des relations de proximité et de qualité. Nous plaçons l'humain au cœur des richesses de l'entreprise.

Chaque jour nous éprouvons de la satisfaction personnelle à être challengés pour vous accompagner de manière personnalisée dans vos projets.

VOUS ÊTES AU CŒUR DE NOS SERVICES

Pour disposer d'un très large éventail de produits disponibles avec réactivité, nous avons fait le choix de constituer des stocks importants. Notre plateforme logistique et l'organisation de nos équipes permettent un traitement rapide des demandes, avec plusieurs co-équipiers fortement impliqués pour assurer la continuité de service et respecter les délais. Nous disposons également d'une équipe de monteurs qui assemblent les composants et assurent le montage des centrales hydrauliques selon les souhaits.

Nos équipes apportent aussi tout le conseil technique pour bien définir les composants dont les clients ont besoin, ou trouver une solution équivalente et adaptée à ce qu'ils recherchent.

Notre longue expérience et le large spectre des secteurs d'activités pour lesquels nous travaillons permettent en effet à nos salariés de s'adapter aux besoins clients, et d'apporter la solution la plus pertinente.

NOTRE SAVOIR-FAIRE EST RECONNU

Nous sommes l'un des leaders français en négoce de composants hydrauliques et pneumatiques, avec l'un des catalogues les plus complets du marché. Depuis 1980 nous sommes le partenaire des constructeurs et revendeurs de matériels.

ÉCHANGEURS DE TEMPÉRATURE

Série S

Édition Juin 2020

Sommaire

Présentation du produit

Gli scambiatori ARIA-OLIO della OMT, nascono per essere installati sulle linee di ritorno dei circuiti oleodinamici.
La speciale conformazione del pacco radiante, realizzato in lega di alluminio che ne esalta le qualità di conducibilità ed il processo di saldobrasatura dei turbinatori e dei condotti, hanno permesso di ottenere un elevato coefficiente di scambio termico e una buona resistenza alla pressione, qualità ottenuta tramite l'utilizzo di materiali altamente qualificati.

OMT air/oil heat exchangers have been designed to be used on the return line of the hydraulic systems.
The special structure of the cooler element in alu-alloy increases the conductivity quality, and the brase welding process of the conduits allows a high thermic exchange and a good resistance to pressure, obtained by using qualified materials.

Specifiche pacco radiante

Materiale	Alluminio
Pressione di esercizio	25 bar
Pressione di collaudo	35 bar
Temperatura max d'esercizio	120 °C

Radiating mass data

Material	Aluminium
Nominal pressure	25 bar
Test pressure	35 bar
Max temperature	120 °C

Compatibilità con i fluidi

Oli minerali, hl, hlp, emulsioni acqua-olio.

Fluid compatibility

Mineral oils, hl, hlp, water-oil emulsion.

Installazione

È consigliabile installare in parallelo allo scambiatore una valvola di By-pass, per proteggerlo durante la fase di avviamento.

Inoltre assicurarsi di non interporre ostacoli alla portata dell'aria.

Installation

We recommend to install a by-pass valve in parallel to the heat exchanger, for its protection during the starting up. Make sure there is no obstacle to the air flow.

Manutenzione

Pulizia lato olio

Lo sporco potrà essere eliminato con il flussaggio di un prodotto detergente o sgrassante compatibile con l'alluminio. Alla fine di tale operazione bisognerà ricorrere all'aria compressa per eliminare i residui che restano all'interno.

Pulizia lato aria

La pulizia dovrà essere effettuata mediante aria compressa o acqua. Durante tale operazione bisognerà prestare particolare attenzione alla direzione del getto per non rovinare le alette. Se lo sporco è causato da olio o da grasso, la pulizia potrà essere effettuata con un getto di vapore o di acqua calda. Durante tali operazioni il motore elettrico dovrà essere scollegato e adeguatamente protetto.

Maintenance

Oil side cleaning

LFlushing with a detergent or a degreasing product compatible with aluminium, eliminates the dirt.
To remove the residuals, use compressed air.

Air side cleaning

It can be done by using compressed air or water and paying attention to the jet direction for not spoiling the vanes. If oil or grease has to be removed, clean with a jet of steam or hot water. Make sure that the electric motor is disconnected and properly protected.

MATERIALI UTILIZZATI

Ventola	Acciaio o plastica rinforzata
Convogliatore	Acciaio o plastica rinforzata
Griglia di protezione	Acciaio o plastica rinforzata

MATERIALS

Fan	Steel or hard plastic
Fan case	Steel or hard plastic
Fan protection	Steel or hard plastic

Déterminez votre échangeur de température

Di seguito sono riportati tre differenti famiglie di scambiatori:
- **serie "SS"** standard
- **serie "SS2"** con doppio passaggio per portate ridotte, ma con maggiore potenzialità di scambio termico
- **serie "SD"** per portate elevate.

Sull'asse delle ascisse viene indicata la portata d'olio che attraversa lo scambiatore, espressa in (lt/min), mentre sulle ordinate è indicato il rendimento di dissipazione per ogni grado centigrado, espresso in (kcal/h °C); oppure in (kW/°C).
Il calore specifico di dissipazione (η) è dato dal rapporto tra la potenzialità termica (Q) dello scambiatore e la differenza di temperatura tra l'olio in entrata e la temperatura ambiente (T°olio - T°aria), con la seguente formula:

$$\eta = \frac{Q\ (kcal/h)}{T^{o}olio - T^{o}aria\ (^{o}C)}$$

Supponendo che lo scambiatore possa dissipare 3000 (kcal/h) e si abbia una differenza di temperatura (T°olio - T°aria) = 30(°C):

$$\eta = \frac{3000\ (kcal/h)}{30\ (^{o}C)} = 100\ (kcal/h\ ^{o}C)$$

Nel caso in cui non sia nota la potenzialità termica (Q) dello scambiatore è possibile calcolarla empiricamente con la seguente formula:

$Q = 0\ ,40 \cdot V \cdot \Delta to$

Dove:
V = portata olio in (lt/h)
Δto = differenza temp. tra olio in entrata e in uscita

0,40 è un valore approssimato o utilizzabile per olio idraulico (nel caso non se ne conoscano il peso specifico e il calore specifico).

0,40 (kcal/lt°C) = c·y
dove:
C = calore specifico (kcal/kg°C)
Y = peso specifico (kg/dm^3)

Supponendo di avere una portata di 6000 (lt/h) e una differenza di temperatura tra olio in ingresso e olio in uscita (Δto) di 8 (°C) la potenzialità termica dello scambiatore è:

$Q = 0{,}40 \cdot 6000\ 8 = 19200$ kcal/h

Here you can find three different series of exchangers:
- **series "SS"** standard
- **series "SS2"** with double passage for reduced flows, but with bigger power of heat exchange
- **series "SD"** for high flows.

On the abscissas you can find the oil flow going through the exchanger, expressed in (lt/min), while on the ordinates you can find the dissipation performance for each centigrade degree, expressed in (kcal/h °C); or in (kW/°C).
The specific dissipation heat (η) is the result of the ratio between thermic power (Q) of the exchanger and the difference of the temperature between oil input and the ambient temperature (oil T° - air T°), using the following formula:

$$\eta = \frac{Q\ (kcal/h)}{oil\ T^{o} - air\ T^{o}\ (^{o}C)}$$

Supposing the exchanger can dissipate 3000 (kcal/h) and you have a temperature difference (oil T° - air T°) = 30 (°C):

$$\eta = \frac{3000\ (kcal/h)}{30\ (^{o}C)} = 100\ (kcal/h\ ^{o}C)$$

When the thermic power (Q) of the exchanger is unknown, it is possible to calculate it empirically using the following formula:

$Q = 0\ ,40 \cdot V \cdot \Delta to$

Where:
V = oil flow in (lt/h)
Δto = temperature difference between oil in and out

0,40 is an approximate value or it can be used for hydraulic oil (when specific weight and specific heat are unknown).

0,40 (kcal/lt°C) = c·y
dove:
C = specific heat (kcal/kg°C)
Y = specific weight (kg/dm^3)

Supposing the flow is 6000 (lt/h) and the difference between oil in and out (Δto) is 8 (°C) the thermic power of the exchanger is:

$Q = 0{,}40 \cdot 6000\ 8 = 19200$ kcal/h

Le curve riportate a catalogo sono valide dal momento in cui si aziona il gruppo di raffreddamento.

La gamma OMT prevede diversi tipi di motorizzazione. Spazia dal motore in C.A. monofase, trifase e trifase unificato B14, a quello in C.C. 12-24V, oltre alla possibilità della predisposizione per il motore idraulico. È consigliato l'utilizzo della tipologia B14 nel momento in cui l'apparecchio ha un funzionamento continuo.

The above curves are valid when the cooler element is activated.

OMT range offers various types of motors. It ranges from C.A. single-phase, three-phase and B14 standardized three-phase motor to C.C. 12-24V motor, in addition to the possibility of the prearrangement for hydraulic motor. We advice the use of B14 type when the equipment runs continuously.

SOCAH HYDRAULIQUE

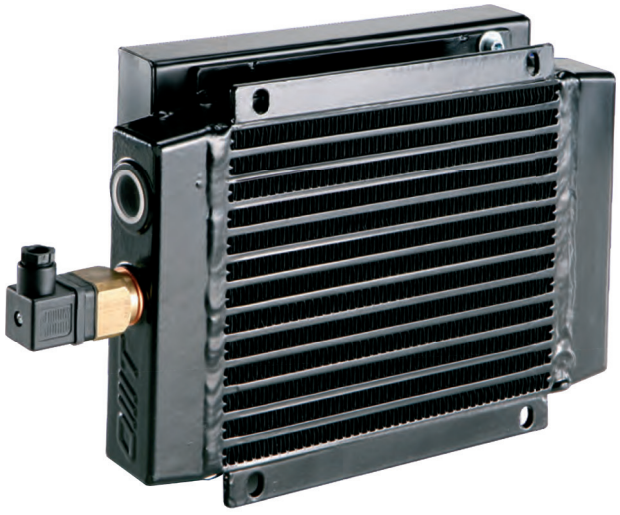
ÉCHANGEURS DE TEMPÉRATURE

Série ST



Édition Juin 2020

Sommaire

Présentation du produit

Gli scambiatori ARIA-OLIO della OMT, nascono per essere installati sulle linee di ritorno dei circuiti oleodinamici.
La speciale conformazione del pacco radiante, realizzato in lega di alluminio che ne esalta le qualità di conducibilità ed il processo di saldobrasatura dei turbinatori e dei condotti, hanno permesso di ottenere un elevato coefficiente di scambio termico e una buona resistenza alla pressione, qualità ottenuta tramite l'utilizzo di materiali altamente qualificati.

OMT air/oil heat exchangers have been designed to be used on the return line of the hydraulic systems.
The special structure of the cooler element in alu-alloy increases the conductivity quality, and the brase welding process of the conduits allows a high thermic exchange and a good resistance to pressure, obtained by using qualified materials.

CARATTERISTICHE TECNICHE

Specifiche pacco radiante

Materiale	Alluminio
Pressione di esercizio	25 bar
Pressione di collaudo	35 bar
Temperatura max d'esercizio	120 °C

Compatibilità con i fluidi

Oli minerali, hl, hlp, emulsioni acqua-olio.

Installazione

È consigliabile installare in parallelo allo scambiatore una valvola di By-pass, per proteggerlo durante la fase di avviamento.
Inoltre assicurarsi di non interporre ostacoli alla portata dell'aria.

Manutenzione

Pulizia lato olio
Lo sporco potrà essere eliminato con il flussaggio di un prodotto detergente o sgrassante compatibile con l'alluminio. Alla fine di tale operazione bisognerà ricorrere all'aria compressa per eliminare i residui che restano all'interno.

Pulizia lato aria
La pulizia dovrà essere effettuata mediante aria compressa o acqua.
Durante tale operazione bisognerà prestare particolare attenzione alla direzione del getto per non rovinare le alette.
Se lo sporco è causato da olio o da grasso, la pulizia potrà essere effettuata con un getto di vapore o di acqua calda.
Durante tali operazioni il motore elettrico dovrà essere scollegato e adeguatamente protetto.

TECHNICAL FEATURES

Radiating mass data

Material	Aluminium
Nominal pressure	25 bar
Test pressure	35 bar
Max temperature	120 °C

Fluid compatibility

Mineral oils, hl, hlp, water-oil emulsion.

Installation

We recommend to install a by-pass valve in parallel to the heat exchanger, for its protection during the starting up.
Make sure there is no obstacle to the air flow.

Maintenance

Oil side cleaning
Flushing with a detergent or a degreasing product compatible with aluminium, eliminates the dirt.
To remove the residuals, use compressed air.

Air side cleaning
It can be done by using compressed air or water and paying attention to the jet direction for not spoiling the vanes.
If oil or grease has to be removed, clean with a jet of steam or hot water.
Make sure that the electric motor is disconnected and properly protected.

MATERIALI UTILIZZATI

Ventola	Plastica rinforzata
Convogliatore	Lamiera
Griglia di protezione	Plastica rinforzata

MATERIALS

Fan	Hard plastic
Fan case	Iron sheet
Fan protection	Hard plastic

Détermination d'un échangeur série ST

Di seguito sono riportati tre differenti tipi di scambiatori:
- **serie "ST"** standard
- **serie "ST2"** con doppio passaggio per portate ridotte, ma con maggiore potenzialità di scambio termico
- **serie "SDT"** per portate elevate.

Sull'asse delle ascisse viene indicata la portata d'olio che attraversa lo scambiatore, espressa in (lt/min), mentre sulle ordinate è indicato il rendimento di dissipazione per ogni grado centigrado, espresso in (kcal/h °C).
Il calore specifico di dissipazione (h) è dato dal rapporto tra la potenzialità termica (Q) dello scambiatore e la differenza di temperatura tra l'olio in entrata e la temperatura ambiente (T°olio -T°aria), con la seguente formula:

$$\eta = \frac{Q\ (kcal/h)}{T°olio\ -\ T°aria\ (°C)}$$

Supponendo che lo scambiatore possa dissipare 3000 (kcal/h) e si abbia una differenza di temperatura (T°olio-T°aria) = 30 (°C):

$$\eta = \frac{3000\ (kcal/h)}{30\ (°C)} = 100\ (kcal/h\ °C)$$

Nel caso in cui non sia nota la potenzialità termica (Q) dello scambiatore è possibile calcolarla empiricamente con la seguente formula:

$Q = 0{,}40\ V\ \Delta to$

Dove:
V = portata olio in (lt/h)
Δto = differenza temp. tra olio in entrata e in uscita

0,40 è un valore approssimato o utilizzabile per olio idraulico (nel caso non se ne conoscano il peso specifico e il calore specifico).

$0{,}40\ (kcal/lt\ °C) = c \cdot y$

dove:
C = calore specifico (kcal/kg °C)
Y = peso specifico (kg/dm^3)

Supponendo di avere una portata di 6000 (lt/h) e una differenza di temperatura tra olio in ingresso e olio in uscita (Δto) di 8 (°C) la potenzialità termica dello scambiatore è:

$Q = 0{,}40 \cdot 6000 \cdot 8 = 19200\ kcal/h$

Here you can find three different series of exchangers:
- **series "ST"** standard
- **series "ST2"** with double passage for reduced flows, but with bigger power of heat exchange
- **series "SDT"** for high flows.

On the abscissas you can find the oil flow going through the exchanger, expressed in (lt/min), while on the ordinates you can find the dissipation performance for each centigrade degree, expressed in (kcal/h°C).
The specific dissipation heat (h) is the result of the ratio between thermic power (Q) of the exchanger and the difference of the temperature between oil input and the ambient temperature (oil T°- air T°), using the following formula:

$$\eta = \frac{Q\ (kcal/h)}{oil\ T°-\ air\ T°\ (°C)}$$

Supposing the exchanger can dissipate 3000 (kcal/h) and you have a temperature difference (oil T°- air T°) = 30 (°C):

$$\eta = \frac{3000\ (kcal/h)}{30\ (°C)} = 100\ (kcal/h\ °C)$$

When the thermic power (Q) of the exchanger is unknown, it is possible to calculate it empirically using the following formula:

$Q = 0{,}40\ V\ \Delta to$

Where:
V = oil flow in (lt/h)
Δto = temperature difference between oil in and out

0,40 is an approximate value or it can be used for hydraulic oil (when specific weight and specific heat are unknown).

$0{,}40\ (kcal/lt\ °C) = c \cdot y$

where:
C = specific heat (kcal/kg °C)
Y = specific weight (kg/dm^3)

Supposing the flow is 6000 (lt/h) and the difference between oil in and out (Δto) is 8 (°C) the thermic power of the exchanger is:

$Q = 0{,}40 \cdot 6000 \cdot 8 = 19200\ kcal/h$

SOCAH HYDRAULIQUE

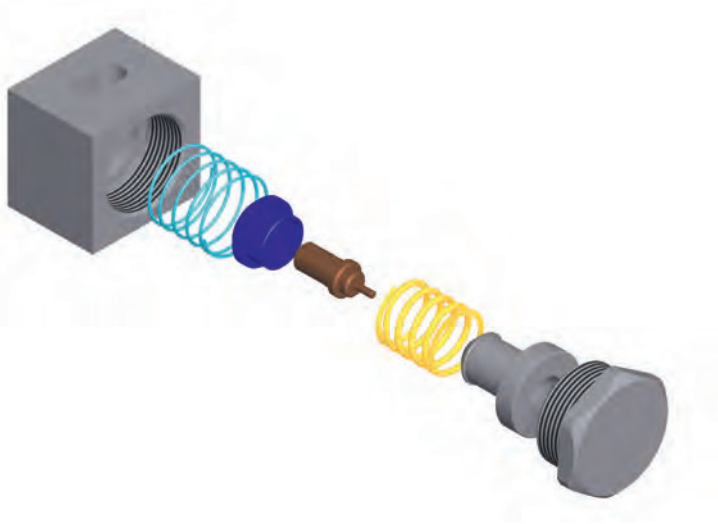
ÉCHANGEURS DE TEMPÉRATURE

Série SSPV

Édition Juin 2020

Sommaire

Cooler with the valve thermostatic by-pass incorporate



Incorporation of the valve thermostatic by-pass in the cooler

Continuous research and technical development lead to the **SSPV heat exchanger** series which consider the needs of the market.

Customers expressed many times dissatisfaction whit the process of assembling heat exchangers.

The main complain was about the obligation of adding an external bypass valve which was able to outflow any high pressure, mainly caused by the variation of oil viscosity and/or multiplication of the flow.

The **SSPV series** can simplify this process of assembly and marking it cheaper :

1 In fact, the SSPV series integrates the by-pass valve and thermostatic valve together in the same heat exchanger. So, it controls any peaks of pressure.

2 The presence of the thermostatic valve is strategic in case of freezing temperatures of the oil as it by-passes the oil outside the core until the oil temperature reaches 40°C

This new series is original because it eliminates many problems such as the loss of load when the oil viscosity is higher. It also allows to increase the temperature inside the pipes, grantig the best control on the oil temperature inside them.

Caractéristiques techniques

Core data

Material	Aluminium
Max Working Pressure	25 bar
Test pressure	35 bar
Max temperature	120 °C

Fluid compatibility

Mineral oils, hl, hlp, water-oil emulsion.

Installation

We recommend to install a by-pass valve in parallel to the heat exchanger, for its protection during the starting up.
Make sure there is no obstacle to the air flow.

Maintenance

Oil side cleaning
LFlushing with a detergent or a degreasing product compatible with aluminium, eliminates the dirt.
To remove the residuals, use compressed air.

Air side cleaning
It can be done by using compressed air or water and paying attention to the jet direction for not spoiling the vanes. If oil or grease has to be removed, clean with a jet of steam or hot water. Make sure that the electric motor is disconnected and properly protected.

MATERIALS

Fan	Steel or hard plastic
Fan case	Steel
Fan protection	Steel or hard plastic

Détermination d'un échangeur SSPV

EXAMPLE

Proceed with sizing the exchanger, with a knowledge of the data as the example below shows:

Power to dissipate	P_{req}	=	25 [kW]
Oil flow	V_{oil}	=	105 [lpm]
Oil input temperature	T_{oil}	=	65 [°c]
Ambient temperature	T_{amb}	=	35 [°c]

Fan operating with an electric motor 230/400V-50Hz.

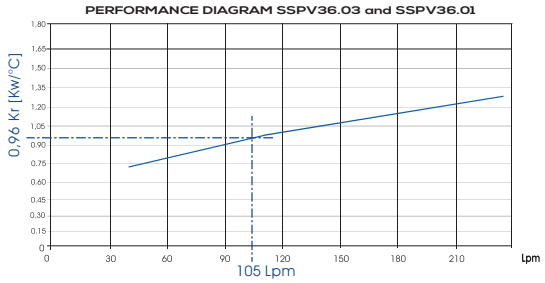
You can then calculate the specific heat exchange power KW/°C if you know the power to dissipate and the ΔT (the difference between the oil input temperature and the ambient temperature).

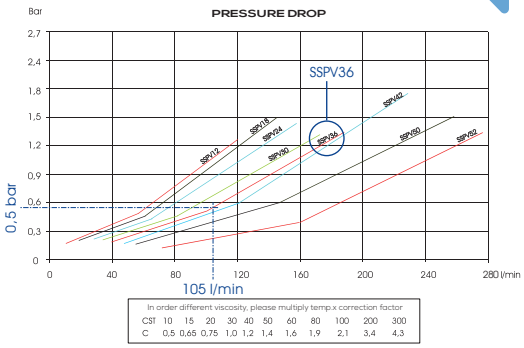
$$Kr = \frac{25\ kW}{65° - 35°} = 0{,}833\ kW/°C$$

Note the oil flow (105 lpm) and specific exchange power (0,833 kW/°C), product research is made by referring to the graph in the catalogue which is relevant to each model.

Oil temperature difference

ΔT_{oil} [°C] = 33 x P_{sel} [kW] / V_{oil} [Lpm]





Results :

Selected cooler : SSPV36.03

Heat rejecting : 0,96 x 30 = 28,8 [kW]

Pressure drop : 0,55 [bar]

Oil temperature difference : ΔT_{oil} [°C] = 33 x 28,8 [kW] / 105 [Lpm] = 9,05 [°C]

Caractèristiques techniques

SCAMBIATORI DI CALORE TIPO ARIA-OLIO
HEAT EXCHANGER AIR-OIL VERSION

Specifiche pacco radiante

Materiale	Alluminio
Pressione di esercizio	25 bar
Pressione di collaudo	35 bar
Temperatura max d'esercizio	120°C

Radiating mass data

Material	Aluminium
Nominal pressure	25 bar
Test pressure	35 bar
Max temperature	120°C

Compatibilità con i fluidi

Oli minerali, hl, hlp, emulsioni acqua-olio.

Fluid compatibility

Mineral oils, hl, hlp, water-oil emulsion.

Installazione

È consigliabile installare in parallelo allo scambiatore una valvola di By-pass, per proteggerlo durante la fase di avviamento.

Inoltre assicurarsi di non interporre ostacoli alla portata dell'aria.

Installation

We recommend to install a by-pass valve in parallel to the heat exchanger, for its protection during the starting up. Make sure there is no obstacle to the air flow.

Manutenzione

Pulizia lato olio

Lo sporco potrà essere eliminato con il flussaggio di un prodotto detergente o sgrassante compatibile con l'alluminio. Alla fine di tale operazione bisognerà ricorrere all'aria compressa per eliminare i residui che restano all'interno.

Pulizia lato aria

La pulizia dovrà essere effettuata mediante aria compressa o acqua. Durante tale operazione bisognerà prestare particolare attenzione alla direzione del getto per non rovinare le alette. Se lo sporco è causato da olio o da grasso, la pulizia potrà essere effettuata con un getto di vapore o di acqua calda. Durante tali operazioni il motore elettrico dovrà essere scollegato e adeguatamente protetto.

Maintenance

Oil side cleaning

LFlushing with a detergent or a degreasing product compatible with aluminium, eliminates the dirt.
To remove the residuals, use compressed air.

Air side cleaning

It can be done by using compressed air or water and paying attention to the jet direction for not spoiling the vanes. If oil or grease has to be removed, clean with a jet of steam or hot water. Make sure that the electric motor is disconnected and properly protected.

SOCAH HYDRAULIQUE
Z.I. du Plessis Beucher - Rue de la croix Guillemet - 35220 CHÂTEAUBOURG - France
Tél : 02 99 000 84 00 - email : contact@socah-hydraulique.fr - Web : www.socah-hydraulique.fr

Di seguito sono riportati tre differenti famiglie di scambiatori:
- **serie "SSV"** standard

Sull'asse delle ascisse viene indicata la portata d'olio che attraversa lo scambiatore, espressa in (lt/min), mentre sulle ordinate è indicato il rendimento di dissipazione per ogni grado centigrado, espresso in (kcal/h oC); oppure in (kW/ oC).
Il calore specifico di dissipazione (h) è dato dal rapporto tra la potenzialità termica (Q) dello scambiatore e la differenza di temperatura tra l'olio in entrata e la temperatura ambiente (T°olio - T°aria), con la seguente formula:

$$\eta = \frac{Q\ (kcal/h)}{T^{o}olio - T^{o}aria\ (^{o}C)}$$

Supponendo che lo scambiatore possa dissipare 3000 (kcal/h) e si abbia una differenza di temperatura (T°olio - T°aria) = 30(°C):

$$\eta = \frac{3000\ (kcal/h)}{30\ (^{o}C)} = 100\ (kcal/h\ ^{o}C)$$

Nel caso in cui non sia nota la potenzialità termica (Q) dello scambiatore è possibile calcolarla empiricamente con la seguente formula:

$Q = 0\ ,40 \cdot V \cdot \Delta to$

Dove:
V = portata olio in (lt/h)
Δto = differenza temp. tra olio in entrata e in uscita

0,40 è un valore approssimato o utilizzabile per olio idraulico (nel caso non se ne conoscano il peso specifico e il calore specifico).

0,40 (kcal/lt°C) = c·y
dove:
C = calore specifico (kcal/kg°C)
Y = peso specifico (kg/dm^3)

Supponendo di avere una portata di 6000 (lt/h) e una differenza di temperatura tra olio in ingresso e olio in uscita (Δto) di 8 (°C) la potenzialità termica dello scambiatore è:

$Q = 0{,}40 \cdot 6000\ 8 = 19200$ kcal/h

Here you can find three different series of exchangers:
- **series "SSV"** standard

On the abscissas you can find the oil flow going through the exchanger, expressed in (lt/min), while on the ordinates you can find the dissipation performance for each centigrade degree, expressed in (kcal/h oC); or in (kW/ oC).
The specific dissipation heat (h) is the result of the ratio between thermic power (Q) of the exchanger and the difference of the temperature between oil input and the ambient temperature (oil T° - air T°), using the following formula:

$$\eta = \frac{Q\ (kcal/h)}{oil\ T^{o} - air\ T^{o}\ (^{o}C)}$$

Supposing the exchanger can dissipate 3000 (kcal/h) and you have a temperature difference (oil T° - air T°) = 30 (°C):

$$\eta = \frac{3000\ (kcal/h)}{30\ (^{o}C)} = 100\ (kcal/h\ ^{o}C)$$

When the thermic power (Q) of the exchanger is unknown, it is possible to calculate it empirically using the following formula:

$Q = 0\ ,40 \cdot V \cdot \Delta to$

Where:
V = oil flow in (lt/h)
Δto = temperature difference between oil in and out

0,40 is an approximate value or it can be used for hydraulic oil (when specific weight and specific heat are unknown).

0,40 (kcal/lt°C) = c·y
dove:
C = specific heat (kcal/kg°C)
Y = specific weight (kg/dm^3)

Supposing the flow is 6000 (lt/h) and the difference between oil in and out (Δto) is 8 (°C) the thermic power of the exchanger is:

$Q = 0{,}40 \cdot 6000\ 8 = 19200$ kcal/h

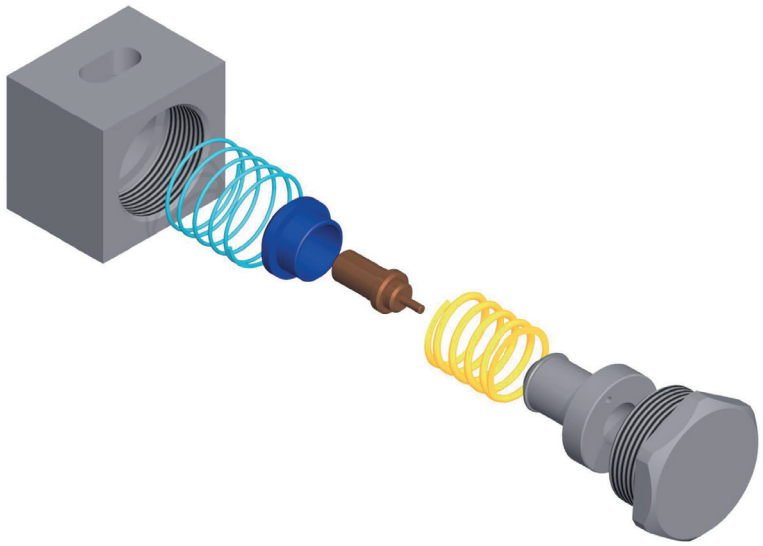
Le curve riportate a catalogo sono valide dal momento in cui si aziona il gruppo di raffreddamento.

La gamma OMT Group prevede diversi tipi di motorizzazione.
Spazia dal motore in C.A. monofase, trifase e trifase unificato B14, a quello in C.C. 12-24V, oltre alla possibilità della predisposizione per il motore idraulico.
È consigliato l'utilizzo della tipologia B14 nel momento in cui l'apparecchio ha un funzionamento continuo.

The above curves are valid when the cooler element is activated.

OMT Group range offers various types of motors. It ranges from C.A. single-phase, three-phase and B14 standardized three-phase motor to C.C. 12-24V motor, in addition to the possibility of the prearrangement for hydraulic motor.
We advice the use of B14 type when the equipment runs continuously.

Valve thermostatique by-pass



INCORPORAZIONE VALVOLA TERMOSTATICA BY-PASS NELLO SCAMBIATORE

La ricerca continua e lo sviluppo tecnico portano alle serie di **scambiatori di calore SSV** che tengono conto delle esigenze del mercato.

I clienti hanno espresso molte volte insoddisfazione per il processo di assemblaggio degli scambiatori di calore.

La lamentela principale riguardava l'obbligo di aggiungere una valvola di bypass esterna che era in grado di superare qualsiasi alta pressione, principalmente causata dalla variazione della viscosità dell'olio e / o dalla moltiplicazione del flusso.

La **serie SSV** può semplificare questo processo di assemblaggio e contrassegnarlo in modo più economico:

1 Infatti, la serie SSV integra la valvola di by-pass e la valvola termostatica nello stesso scambiatore di calore. Così da controllare eventuali picchi di pressione.

2 La presenza della valvola termostatica è strategica in caso di temperature di congelamento dell'olio in quanto by-passa l'olio all'esterno del nucleo fino a quando la temperatura dell'olio raggiunge i 40 ° C.

Questa nuova serie è originale perché elimina molti problemi come la perdita di carico quando la viscosità dell'olio è maggiore. Permette inoltre, di aumentare la temperatura all'interno dei tubi, garantendo il miglior controllo della temperatura dell'olio al loro interno.

INCORPORATION OF THE VALVE THERMOSTATIC BY-PASS IN THE COOLER

Continuous research and technical development lead to the **SSV heat exchanger** series which consider the needs of the market.

Customers expressed many times dissatisfaction whit the process of assembling heat exchangers.

The main complain was about the obligation of adding an external bypass valve which was able to outflow any high pressure, mainly caused by the variation of oil viscosity and/or multiplication of the flow.

The **SSV series** can simplify this process of assembly and marking it cheaper:

1 In fact, the SSV series integrates the by-pass valve and thermostatic valve together in the same heat exchanger. So, it controls any peaks of pressure.

2 The presence of the thermostatic valve is strategic in case of freezing temperatures of the oil as it by-passes the oil outside the core until the oil temperature reaches 40°C.

This new series is original because it eliminates many problems such as the loss of load when the oil viscosity is higher. It also allows to increase the temperature inside the pipes, grantig the best control on the oil temperature inside them.

On the instrument are settled the value of engine's start and the value at which the engine reaches the max speed. Within these values of temperature the engine speed adapts automatically to every temperature variations. The electric engine starts in a "soft-start" condition, with a progressive increase of the rotation during 30" or following a specific request indicated by the customer before the order. In addition this series includes a timed program that reverses the rotation of the engine: after 9 minutes of operative direction of rotation the engine stops, within 15" restarts and rotate for 60" with the opposite direction of rotation, then stops again and restart with the operative direction for 9 minutes. The instrument is made in one part in Brass that will be connected directly in contact with the fluid that need to be checked.

MANUALE DI USO E MANUTENZIONE SCAMBIATORI DI CALORE SS – ST – SD – SSPV - SSV

INSTALLAZIONE

Gli scambiatori di calore aria/olio vengono normalmente utilizzati per il raffreddamento di impianti oleodinamici collegati sulla linea di scarico dove la pressione di esercizio non supera i 25 bar (massima ammessa per gli scambiatori aria/olio).
Nel caso in cui la pressione di scarico superi i 25 bar (moltiplicazione di portata, viscosità olio), gli scambiatori vengono inseriti nei Sistemi di Raffreddamento Autonomo dotati di pompa di ricircolo e by-pass.
E' consigliabile montare gli scambiatori su antivibrati ed effettuare il collegamento di ingresso e uscita olio con tubi flessibili.
Gli scambiatori dovranno essere installati in modo che non vi siano ostacoli alla potata dell'aria: pertanto la distanza posteriore e quella anteriore deve essere pari o superiore al raggio della ventola montata (schema 2).
Se l'impianto oleodinamico è posto in ambienti dove la temperatura dell'olio è soggetta ad elevata escursione termica è consigliabile montare una valvola by-pass in considerazione che con basse temperature la viscosità dell'olio aumenta sensibilmente provocando forti perdite di carico che, nella maggior parte dei casi, supera la pressione massima ammessa (schema 1).

COLLEGAMENTO PARTE ELETTRICA

Assicurarsi che la tensione V, la fequenza Hz e il senso di rotazione dell'elettroventola siano come indicato nella targhetta posta in modo visibile sugli scambiatori. Seguire attentamente quanto descritto nello schema elettrico allegato. (schema n.3)

MANUTENZIONE LATO ARIA

Scollegare elettricamente lo scambiatore.
Smontare il convogliatore, l'elettroventola e l'eventuale termostato.
Tutte le impurità possono essere rimosse con un getto d'acqua calda facendo attenzione che la direzione dello stesso sia parallelo alle alette per facilitare la fuoriuscita dello sporco.

MANUTENZIONE LATO OLIO

Scollegare idraulicamente lo scambiatore; flussare contro corrente lo scambiatore con sostanze sgrassanti non aggressive per l'alluminio.
L'intensità dello sporco deteminerà la durata di tale.
Nel caso non fosse sufficiente ripetere più volte l'operazione.

USE AND MAINTENANCE HEAT EXCHANGER SS – ST – SD – SSPV - SSV

INSTALLATION

Air/oil heat exchanges are generally used for cooling oleodynamic equipments linked on the exhaust line where the exercise pressure isn't over 25 bar (max pressure admited for air/oil heat exchangers). If the exhaust pressure is over 25 bar (flow multiplication, oil viscosity) the heat exchangers are placed into indipendent cooling systems with recirculation pump and by-pass.
It' s advisable to mount the heat exchangers on anti-vibrants and to link inlets and outlets with flexible tubing.
The heat exchangers must be installed in order that there aren't obstacles to the air flow: the anterior and posterior distance has to be as much or superior to the radius of the fan mounted (scheme 2).
If he oleodynamic equipment is placed in environments where the oil temperature is subject to hight temperature range it's advisable to mount a byv-pass valve since with low temperatures oil viscosity rises considerably causing hight pressure drops that, in most cases, are bigger than the max pressure allowed. (scheme 1)

ELECTRIC PART LINKING

Please be sure that Tension V, frequency Hz and rotation direction of the electric fan are as shown by the plate mounted on the heat exchangers. Follow accurately what's written in the electric scheme attached (scheme 3).

AIR SIDE MAINTENANCE

Disconnect electrically the heat exchanger.
Disassemble the conveyor, electric fan and thermosta (if present). All the impurities can be removed with a warm water jet paying attention that its direction is parallel to the fins to help with the discharge of the dirt.

OIL SIDE MAINTENANCE

Disconnect hydraulically he heat exchanger; flux against the flow the heat exchanger with degreasing substances not aggressive for aluminium.
The intensity of the dirt will determine the duration of this operation that usually lasts from 15 to 30 minutes.
In case the desired clening isn't achieved repeat the operation as many times ad needed.

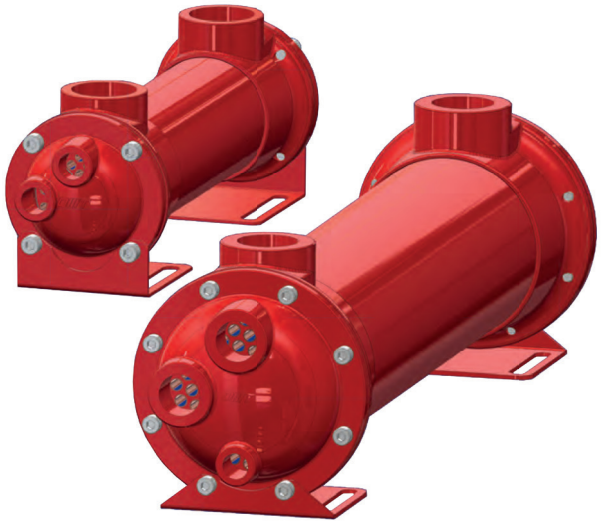
ÉCHANGEURS DE TEMPÉRATURE EAU/HUILE

Série SA



Édition Juin 2020

Sommaire

Présentation du produit

Gli scambiatori acqua olio serie “SA” a fascio tubiero sono realizzati mediante le tecnologie costruttive più moderne ed affidabili per uso in condizioni termomeccaniche anche gravose.
La portata d’olio di tali scambiatori varia dai 20 L/min ai 550 L/min e le superfici di scambio termico vanno da 0,26 m^2 a 7,057 m^2.

I tubi in rame mandrinati sulle piastre garantiscono una maggiore resistenza e tenuta anche in presenza di vibrazioni.

La fitta conformazione del fascio tubiero consente di avere un’ottima resa termica fino a 75 kW con consumi d’acqua ridotti e dimensioni contenute; inoltre il circuito d’acqua è ispezionabile.

La gamma si articola in due diverse tipologie di prodotto: quella standard con tubi in CuDHP (Rame), per impiego con ogni tipo di acqua industriale, e la versione per utilizzo in ambiente marino, con tubi in CuproNichel 90/10.

OMT è in grado di valutare e realizzare versioni speciali su richiesta del cliente.

The new WATER – OIL heat exchangers SA series “shell and tube” are manufactured based on the most advanced technologies in order to make them very reliable even in hard working conditions.
They are suitable for oil flows from 20 lt/min to 550 lt/min; thermal exchange surfaces range from 0,26 m^2 to 3,67m^2.

The water circuit is inspectable and designed to get the maximum water saving.

The tube bundle is made of a very high number of thin tubes to optimize the thermal yield until 75kW within a compact layout; all the copper tubes are rolled into the tube plates to achieve the best performance even if vibrations take place.

The SA series has two subseries: the standard one made of CuDHP (copper) tubes for all industrial applications and the sea water one using CuproNichel 90/10 tubes.

On demand special solutions can be provided.

Déterminez voutre échangeur de température série SA

Esempio di scelta dello scambiatore di calore

DATI :

Portata olio	: 60 [lt/min.]
Peso specifico	: 0,88 [Kg/dm³]
Calore specifico	: 0,49 [Kcal/Kg °C]
Viscosità	: 32 [cst]
Temperatura IN olio	: 55 [°C]
Temperatura IN acqua	: 20 [°C]
Potenza da dissipare	: 15 [KW]

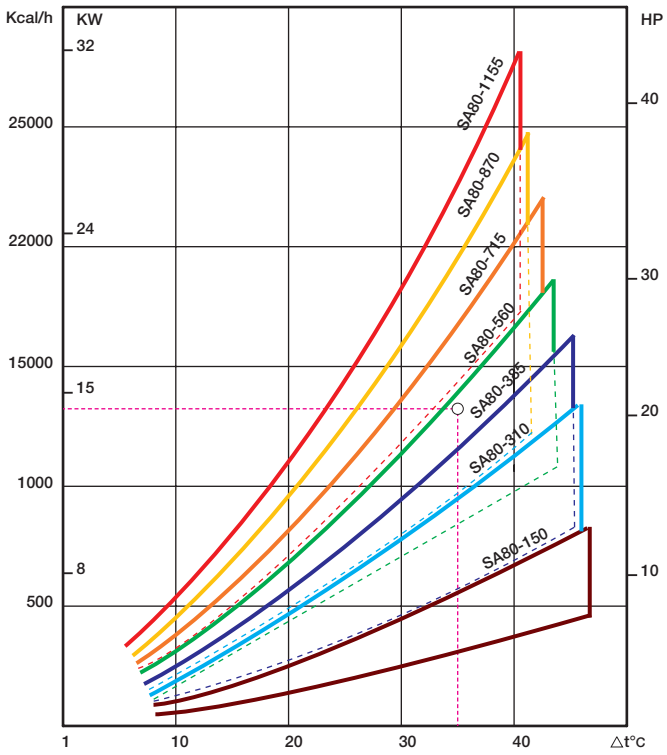
Conoscendo la portata dell' olio, la potenza da dissipare, e stabilito il T, ovvero la differenza tra la temperatura ingresso olio e la temperatura ingresso acqua, si può ricercare sui diagrammi riportati a catalogo lo scambiatore idoneo.

Data relating to heat exchanger selection

DATA :

Oil flow	*: 60 [lt/min.]*
Specific weight	*: 0,88 [Kg/dm³]*
Specific heat	*: 0,49 [Kcal/Kg °C]*
Viscosity	*: 32 [cst]*
Oil temperature	*: 55 [°C]*
Water temperature	*: 20 [°C]*
Cooling power	*: 15 [KW]*

Knowing the fluidity and flow rate of the oil, cooling power and stability of T (IN runnig temperature of oil - water temperature) you can adjust these calculations to the specifications given in our catalogue.



TIPO TYPE	PORTATA OLIO OIL FLOW (lt/min)	HP DISPERS CON OLIO HP DISSIPATED WITH OIL -55°C H20-20°C
SA 080-150-...	25 - 75	4 - 8
SA 080-310-...	25 - 80	7 - 14
SA 080-385-...	25 - 80	9 - 17
SA 080-560-...	25 - 80	12 - 20
SA 080-715-...	40 - 100	15 - 24
SA 080-870-...	40 - 110	18 - 29
SA 080-1155-...	40 - 130	22 - 36

Lo scambiatore selezionato risulta il modello SA080-870-S4.
La dissipazione segnata nel diagramma di rendimento espressa in HP si ottiene con viscosità pari a 32 cst e portate acqua indicate nella seguente tabella A:

Selected exchangers results in the model SA080-870-S4.
The marked dissipation on the exchange diagram expressed in HP will be arrived, with a viscosity of 32 cst and water flow as indicated in our following table A:

CABSOC GROUP
UN GROUPE À TAILLE HUMAINE

5 ENTREPRISES

12 ACTIVITÉS

1 PROJET COMMUN

CABSOC Group réunit 5 PME indépendantes, expertes et complémentaires, proposant une offre globale de qualité qui couvre les métiers et marchés de l'hydraulique en France et à l'étranger : SOCAH Hydraulique, Luce Hydro, EDH, ID System, SOCAH Connectic.

Chacune a son histoire, et toutes sont porteuses de valeurs communes, orientées service clients : engagement, réactivité, entraide, simplicité.

Ces valeurs guident les actions de notre modèle économique et humain, qui met au cœur de ses préoccupations toutes ses parties prenantes : clients, co-équipiers, fournisseurs, société civile…

Ce modèle privilégie la liberté d'entreprendre de nos PME, soutenues par la stratégie et la force d'un Groupe.

LES CHIFFRES CLÉS

35M€ de CA en 2022

185 Co-équipiers

5 sites de production

NOS ACTIVITÉS

La fabrication

Le Négoce

Le dépannage au comptoir

NOS MOYENS

Équipes conseil & technique

Stock permanent

Livraison rapide

NOS 5 PME SONT ATTACHÉES À :

- entretenir des relations durables, de proximité, personnalisées, avec clients, co- équipiers, et fournisseurs ;
- incarner sur le terrain nos valeurs partagées ;
- cultiver chacune ses spécificités, ses atouts distinctifs.

LE GROUPE EST LÀ POUR :

- renforcer la performance globale : qualité produits / services, disponibilité, tarifs ;
- mutualiser les services supports ;
- partager les fruits de la R&D ;
- sécuriser la solidité financière ;
- et œuvrer en acteur engagé sur les territoires où ses PME sont implantées.

Aujourd'hui, dirigé par Benoît CABANIS, petit-fils du fondateur, CABSOC Group est une entreprise française, avec une dimension internationale, importatrice de composants et exportatrice d'équipements mécatroniques.
